PROFESSIONAL SUMMARY

Full-stack developer with three years of production experience, built through a deliberate progression from project delivery into software. For two years I integrated eGauge revenue-grade meters into Eagles, a live energy monitoring platform, connecting hardware APIs to eagles.eenovators.com and sitting in the build meetings through every stage of the product. I now hold two concurrent software roles: contracted technical support and QA on AIM Dynamics' ADM Director portal, and full-stack development at TechSavannah, a move I made specifically to deepen my engineering practice inside a dedicated software company. I build with React, Flask and PostgreSQL, and I have taken one system from requirement to working software on my own. What I bring that most junior developers do not is that I have stood at the switchboard: I know what the data means before it reaches the API.

TECHNICAL SKILLS

Languages JavaScript, Python, SQL, HTML5, CSS3

Frontend React (component architecture, hooks, state management), responsive UI, HTML/CSS

Backend Flask, RESTful API design, consuming and integrating third-party APIs

Data PostgreSQL, relational schema design, time-series interval data, data validation and reconciliation

Hardware & IoT integration eGauge REST API integration, meter onboarding and commissioning onto a live analytics platform, interval-data verification, gap diagnosis; working familiarity with DENT, AccuEnergy and ADM hardware and Modbus / BACnet

Testing & QA Requirements-based acceptance testing, functional and regression testing, defect reproduction and triage, release verification

Tools Git, GitHub, Bitbucket, Postman, VS Code

Ways of working Branch-and-PR workflow, code review, Agile delivery, technical documentation, remote/asynchronous collaboration

Domain & languages Energy monitoring and metering, solar PV delivery, construction and logistics project management · English (fluent), Kiswahili

PROFESSIONAL EXPERIENCE

Software Developer — Technical Support & QA | AIM Dynamics (Contract) *2026 – Present*

Held concurrently with the TechSavannah role. AIM Dynamics is the US-based manufacturer of the ADM Director energy gateway and meter range.

- Part of the development team building the ADM Director portal, the web platform behind AIM Dynamics' metering hardware.
- Provide technical support across the development cycle — investigating defects, reproducing issues and verifying fixes before release.
- Test application code against functional specifications and customer requirements, so releases ship against a defined acceptance bar rather than assumption.
- Coordinate asynchronously with a distributed team across time zones while delivering a separate full-time role.

Software Developer | TechSavannah Limited — Westlands, Nairobi *May 2026 – Present*

Joined a dedicated software company by choice, to deepen engineering practice inside a full-time development team.

- Build production web applications using React on the frontend and Flask on the backend, to clean, maintainable code standards.
- Design and integrate RESTful APIs connecting user interfaces to backend services and the PostgreSQL data layer.
- Participate in code reviews and feature planning, and apply optimisation techniques to improve performance and maintainability.

Software Developer — Meter Integration, Eagles Platform | Eenovators Ltd *2024 – April 2026*

Eagles (eagles.eenovators.com) is a live, multi-tenant energy analytics platform — real-time dashboards, anomaly detection and tariff analysis — serving commercial and industrial clients in Kenya and Tanzania.

- **eGauge API integration —** connected eGauge revenue-grade meters to the Eagles platform through the eGauge REST API: device configuration, credentials and endpoints, channel mapping, and verifying that interval data landed correctly and continuously in the platform.
- **Site onboarding —** commissioned meters onto the platform across client sites, confirming that what the dashboard showed matched the physical installation on the switchboard.
- **Data quality and fault diagnosis —** investigated missing and gapped interval data, separating device-side causes (offline meters, network loss, credential failures) from platform-side issues, and drove each to resolution.
- **Two years across every stage of the product —** took part in build and review meetings from early development through live client operation, feeding field reality back into requirements and testing features against how meters and sites actually behave.

Construction Lead — Uasin Gishu Development | Eenovators Ltd *2024 – 2025*

- **Built the rental income management system —** a full-stack Python/Flask and React application tracking tenants, units, rent billing, payment collection and arrears for the completed development. Self-initiated once the units were tenanted: I identified that the project needed software, not a spreadsheet, and built it.
- Led the multi-phase construction build from initiation to handover — planning, budget allocation, timeline control and onsite team coordination — delivered on schedule with zero safety incidents.

Project Lead — Eenova Express (Solar PV & Logistics Division) | Eenovators Ltd *2024*

- Led Eenova Express, a company division set up to manage logistics and solar PV project logistics, from launch through live operation.
- Coordinated delivery routing, supply chain and field crews so solar PV installations were never blocked and projects met their completion dates.
- **Built and maintained the division's web presence —** designed and shipped the Eenova Express page on the company website while the division was live, the first thing I built that customers actually used.

Software Development Attachment | Eenovators Ltd *May – October 2023*

- Development and maintenance work on the company website — feature updates and content-driven changes — and built the foundational version control, code review and release practice the later Eagles work was built on.

Solar Project Oversight Officer | IOM — Kakuma & Ugenya, Siaya *May – July 2023*

- Technical oversight and quality assurance for solar installation activities delivered with the International Organization for Migration across two field sites, monitoring progress against programme milestones and maintaining technical documentation for handover.

SELECTED PROJECTS

Eagles Energy Monitoring Platform *— production, multi-client (Eenovators Ltd)*

Multi-tenant platform turning raw meter readings into decisions: real-time dashboards, anomaly detection and tariff-aware cost analysis. My contribution over two years was the hardware-to-platform link — integrating eGauge meters via their REST API, onboarding client sites, and keeping the interval data flowing and trustworthy once they were live.

Stack: eGauge REST API · meter commissioning · interval-data validation · PostgreSQL-backed analytics platform

Rental Income Management System *— built end-to-end, moving to production*

Designed and built end-to-end to manage rental income for the Uasin Gishu development after delivering the build itself: tenant and unit records, rent invoicing, payment capture and arrears tracking. Currently being moved onto production hosting. The clearest example of taking a real business problem from requirement to working software single-handedly.

Stack: Python (Flask) · React · PostgreSQL · Git/GitHub

ADM Director Portal *— in active development (AIM Dynamics)*

Web portal for AIM Dynamics' ADM Director energy gateway and meter range. Contributing on technical support and quality assurance — testing code against customer requirements, reproducing and documenting defects, and verifying releases behave as specified.

EDUCATION & TRAINING

Bachelor of Science in Information Technology | KCA University *Ongoing*

- Currently pursuing; building depth in software engineering, database systems, networking, systems analysis and design, and information security to complement hands-on full-stack development work.

Software Development Bootcamp | Moringa School *2025*

- Intensive full-stack web development programme covering modern JavaScript frameworks, backend services, databases, version control and industry engineering practice.

Diploma in Information Technology | KCA University — *November 2023*

- Software development, systems design and IT infrastructure.

Certificate in Information Technology | KCA University — *November 2021*
